'Expert Test Attack' is defined hereunder as per recognized testing procedure:— (a) The testing party shall consist of two experienced operators who have studied the sample safe and are fully familiar with its detailed construction, and operation They will also have fully studied detailed component and assembly drawing of the safe (b) The tools available shall be all the common hand tools including sledge hammers; up to 3.5 kg size and crow bars upto 1 1/2 meters long Power tools will include portable electric impact hammers upto 25 mm size, portable drill presses or drill holding mechanism to accommodate portable electric drill upto 12mm in size carbide tipped drills will be used (and not just plains HSS drills). Also power saws upto 200 mm in diameter and hole saws upto 62 5 mm in diameter and reciprocating saws with maximum blade length 200 mm. (c) The objective will be of either making a hole of minimum 40 sq cm or knocking of the lock and welding open the door. (d) The total above test attack will last for a specific time.

1	2	3	4
			(IV) Jewellers safe which can withstand 'Expert Test. Attack' 'Expert Test Attack' is defined here under as per recognised testing procedure:— This will be as per the fire and Burglar Resistant Safe described above, but with the following vital additions: (a) Oxy-Acetylene gas cutting torch will be for attack. The quantity of gas consumed shall be limited to 30 cu.m. of combined total oxygen and fuel gas. (b) One combination Lock is mandatory on these safes. The lock should be manipulation proof and be capable of one million different combinations. (c) There shall be provision for fitting a 2 movement time lock. (d) The safe will have several automatic locking devices activated by components breaking, explosives, very high temperature and severe shock to automatically relock the safe. Also in case any lock is dislodged by means of explosives or other means, the safe will automatically re-lock. (e) The objective of the attack will be to make a hole of 13 sq. cm. (f) The attack is required to last for twice as long as for the Fire and Burglar Resisting Safes. (V) SAFE DEPOSIT LOCKER The locker doors will have milled edges to permit close seating, thus ensuring not only great resistance to crow bar attack but also interchangeability with each other. This is vital from the servicing point of view. The locks will be interchangeable between themselves which is again absolutely vital for servicing purposes. Each lock is jointly controlled by the renter with a renter's key; and by the custodian who has one master key for the entire installation which may be several hundred of lockers. The lock lever combinations shall be computer generated to ensure that no two keys are identical and that its own key alone will open lock This loss of keys by the renters is a common feature and a system of breaking open (no duplicate keys of records are kept), urgently repairing the door and refitting with a new interchageable lock, are vital serving matters. Also occasionally there is a loss of the custodians key putting hundred of Lockers in jeopardy. In this case a mechanic has to be deputed to camp at site, customers are called one by one and lockers opened in their presence and the custodians part of the lock mechanism changed to suit the new master key. This is a major operation. (VI) SAFES WITH SAFE DEPOSIT LOCKERS This can be specified as incorporating all the special features of both a Fire Burglar Resistant Safe and the Safe Deposit Locker as indicated above. This term is used in Banks which do not have their own reinforced vault and also in large hotels as a service to their customers for keeping their valuables. Here the ability for urgent service to hotel guests who may have lost their keys and may have valuables

			like money, airline tickets and passports, is very vital One other vital point is that the most popular size is the 2085 mm high unit which weigh is around 2.5 tonnes and requires an overhead crane during its manufacture.
